

A concise guide to the 8 high-impact AI capabilities available for the platform, categorized by capability level (Level 1: Core, Level 2: Advanced, Level 3: Enterprise).

1. AI Sourcing Concierge ("Ask SeekFactory")

LEVEL 1 · CORE

Problem: Standard search boxes fail because industrial requirements have strict engineering parameters (tolerance, machine type, materials) that keywords cannot capture.

Solution: A conversational assistant that understands technical parameters and instantly matches verified factories from the database.

Example: A buyer types: "Need 5-axis CNC machining for aerospace aluminum 7075 with $\pm 0.005\text{mm}$ tolerance for 500 pcs." → AI immediately shows 3 verified factories with DMG MORI 5-axis machines ready to quote.

2. Real-time Technical B2B Chat Translation (EN/Hi ⇌ ZH)

LEVEL 1 · CORE

Problem: Indian buyers and Chinese plant engineers face language barriers. Generic tools like Google Translate mistranslate specialized manufacturing jargon, causing defective production runs.

Solution: In-chat translation that accurately translates specialized manufacturing terminology in both directions in real time.

Example: Buyer types: "Ensure wire EDM surface roughness is Ra 0.8 and confirm anodizing thickness in microns." → Factory engineer instantly reads accurate technical Mandarin (线切割 Ra 0.8 & 阳极氧化膜厚度).

3. Smart RFQ Builder (Spec & Drawing Extractor)

LEVEL 2 · ADVANCED

Problem: Writing RFQs is tedious and complex; over 60% of buyers abandon the form or submit incomplete details (missing Incoterms, MOQ, tolerances).

Solution: Buyers upload an engineering drawing (PDF/image) or rough notes; AI extracts technical specs and pre-fills the entire RFQ form automatically.

Example: Buyer uploads a 2D PDF drawing of a valve block → AI automatically fills: Product Name: "Hydraulic Valve Block", Material: Ductile Iron GGG40, Tolerance: H7, and suggested Incoterm: FOB Ningbo.

4. Reels Video Auto-Transcription & Bilingual Subtitles

LEVEL 2 · ADVANCED

Problem: Chinese factory managers narrate machine demonstrations in Mandarin, making video reels uninformative to Indian and international buyers.

Solution: AI transcribes Mandarin audio, generates synchronized English subtitles directly on the video, and creates English titles and category tags.

Example: A manager narrates a 600-ton die-casting test in Mandarin → Video displays English subtitles: "Our 600-ton die casting unit produces aluminum transmission cases at 45s cycle times." with #DieCasting tags.

5. Supplier Quotation Comparator & Recommendation

LEVEL 2 · ADVANCED

Problem: Buyers get overwhelmed comparing 3–5 quotes with different shipping terms (\$4.20 FOB Ningbo vs \$4.60 CIF Mumbai) and different delivery times.

Solution: An automated decision assistant that standardizes quotes side-by-side and recommends the best supplier based on price, speed, and reliability.

Example: Buyer receives 4 quotes for 2,000 shafts → AI highlights: "Supplier B offers the lowest price (\$3.80/unit), but Supplier A delivers 14 days faster with verified ISO 9001 rating. Recommendation: Choose A for urgent delivery, B for cost savings."

6. Visual "Snap to Source" (Photo Part Matcher)

LEVEL 3 · ENTERPRISE

Problem: Plant engineers frequently hold a broken machine part in hand, but have no part number, drawing, or technical term to search for it online.

Solution: The user takes a photo of the physical component with the mobile app; AI identifies the part type, manufacturing method, and metal alloy, finding matching suppliers immediately.

Example: Engineer snaps a photo of a broken loom gear → AI identifies: "Spiral Bevel Gear, Module 3.5, Alloy Steel" and instantly displays 4 verified gear-manufacturing plants capable of producing replacements.

7. India–China Landed Cost & Customs Duty Calculator (HS Code AI)

LEVEL 3 · ENTERPRISE

Problem: Indian buyers hesitate to purchase from China due to fear of unexpected port customs duties, freight surcharges, and IGST taxes.

Solution: AI assigns the correct 8-digit Indian Customs HS Code and calculates the total landed cost in Indian Rupees (INR) delivered to the buyer's factory gate.

Example: A fiber laser machine is listed at **\$14,000 FOB Shanghai** → AI itemizes freight, Basic Customs Duty (7.5%), SWS, and IGST to calculate: "Total Landed Cost: ₹15,67,307 INR (₹2,39,080 claimable as GST credit)."

8. Video Reels Personalization Engine

LEVEL 3 · ENTERPRISE

Problem: B2B buyers have narrow industrial interests. A textile plant buyer will leave the platform if their video feed is flooded with plastic molding or mining equipment.

Solution: An algorithm that observes buyer watch time, pauses on machine specs, and past RFQs to personalize their "For You" video feed with relevant industrial equipment.

Example: A buyer pauses on CNC Swiss lathe reels and recently requested quotes for precision pins → Feed adapts within 24 hours to feature micro-machining and precision turning demonstrations.
